

As a totally independent consultancy practice, we provide our clients with cost effective information technology solutions that match their real business needs, enhance their competitiveness and provide them with an excellent return on their investment.

Our teams are committed to planning and developing many types of business networks, overseeing their installation and providing the training and ongoing support that ensures their continuing successful operation, even as their working environments inevitably change over time. To achieve this, they utilise whatever resources are most appropriate to the individual project.

Support Contracts . Virus Screening . Remote Access . Disaster Recovery . E-mail Screening

Making IT Work

We are committed to achieving a close working relationship with all our clients and with several premier vendors whose products we recommend and services we use on our clients behalf. We believe that business relationships are for the long-term and that our commitment to each and every project we undertake must reflect that.

Local Area Networks . E-mail & Internet Connectivity . Broadband & ADSL . Virus Protection . Training

We as a company have formed a number of business partnerships to enable us to deliver the type of service you require. The main Business Partnerships can be seen in the diagram to the right:

Unigold's network team was formed to specifically address the rapidly growing market for network solutions in the enterprise sector. To source, install, manage and maintain networks is a considerable drain on resources, especially where there is no existing IT function. We can help by providing a range of core services.

Where companies have an existing IT resource that does not cover network technology, we can work within the existing structure enhancing the quality and range of the IT resource.
